css framework

<https://bulma.io/>

<https://developer.spotify.com/web-api/search-item/>

Spotify's API has a search endpoint which can search by genre if you scroll down to "Field filters". You could search by genre and then pick a random song out of the list? You could use the `limit` and `offset` params to switch up your song list so you're not picking from the same 10 or 20 songs every time. This will return the track's URI, which you can then use to play in a [Spotify Play widget](#). Use the song URI returned from the API to load the song into the widget.

If you're looking for a web API that will play a song for you, that's not really possible. Audio playback is all done from the client, so you'll have to play the audio or load the Spotify widget yourself.
